

Engineering Arena 2026

The Brief

This year, your task consists of solving multiple smaller exercises covering different engineering disciplines. Instead of a design competition - this year we are presenting a problem solving competition. With the rapid growth of LLM usage we want to accentuate their benefits - not negatives. So, instead of giving you a design task, we want you to return to the base of engineering - learning. Not only are you allowed to use LLMs to assist you - we encourage you to use these tools to help you in solving the tasks you will be presented with.

We have tasked a number of our friends and colleagues in designing interactive tasks that cover all possible facets of various engineering fields. We hope that through you helping the little robot Stemo, you'll learn more about engineering and its applications, making you feel proud of the lifepath you chose for yourself as a future engineer - whatever your field may be.

Rules

The game consists of 20+ small tasks. Solving each task gives you points based on the speed you solve the task - with a bonus for finishing all games in one go through! Each game requires you to enter the solution using the interactive web page - guessing, and solving games, will cost you energy. Don't worry - Stemo has more than enough energy, provided you don't tire him out too much by giving wrong answers.

Helping Stemo is available during the first and second day. Points from both days are added together. Each task you complete requires an uploaded document showing your work and calculations. Please name each document clearly.

Final Word

The best teams will present how they approached the game and problem solving on the third day; presentation skills and ingenuity may earn additional points.

We hope you enjoy the little game we prepared. Please forgive any mistakes and bugs that may have found their way into it. Now - let's go - join Stemo on his adventure, rescuing Athena from the evil Čato Džipitijević!

ADVENTURE**

Mirta & Sandi
Engineering Arena Mentors

doc. dr. sc. Sandi Baressi Šegota univ. mag. ing.
comp.

Assistant professor at Faculty of Informatics Pula, focused on AI in complex engineering systems, robotics, and evolutionary computing.

Tech Lead at Dagnostics and Liberiq.

[LinkedIn](#)

Mirta Čolić univ. mag. ing. el.

FER-educated engineer at Ericsson Nikola Tesla. Rector's Award recipient for SimplyDigitize, a photogrammetry-based 3D digitization system.
